

THE ERA OF AI

WHAT'S DIFFERENT

Intelligence that works the way you do.

Six capabilities that redefine what an AI assistant can achieve — from reasoning to creation.

Deep Reasoning

Multi-step logical chains that break down complex problems into solvable parts, tracing every assumption.

200K Context Window

Process entire books, codebases, and document sets in a single session — no chunking, no loss of continuity.

Code Generation

Full-stack applications from natural language. Write, test, debug, and deploy — all within the conversation.

Multimodal Input

Analyze images, charts, PDFs, and screenshots — extract insights, translate visuals, annotate outputs.

Tool Use

Connect to APIs, query databases, run shell commands — the assistant acts on your behalf, securely sandboxed.

Constitutional Safety

Alignment through principles, not patches. Every response is governed by transparent, auditable constraints.

IN PRACTICE

See the intelligence at work.

STEP 01

Transparent reasoning

Every answer traces its logic — assumptions, alternatives, and confidence. You see not just what it thinks, but how it got there.

Explain the Monty Hall problem and why
switching doors is the right strategy

Let me reason through this step by
...step

Step 1: Initial probability — you pick door
.1, $P(\text{car}) = 1/3$

Step 2: Host opens a goat door, but
host's choice is constrained. The key
insight: your initial door still has $1/3$
chance. The remaining door absorbs the
probability of the opened door $\rightarrow 2/3$

Build a REST API for a todo app with
Express and TypeScript.

STEP 02

```
// src/routes/todos.ts
router.get('/', async (req, res) => {
  const todos = await Todo.find();
  res.json(todos);
});
```

STEP 03

Data-driven insights

Upload spreadsheets, CSVs, or connect to live data sources. Receive instant analysis, visualizations, and strategic recommendations.

Design a landing page for a premium AI assistant — white, warm grays, orange accents.

I'll create a complete HTML/CSS prototype with Three.js hero, GSAP animations, and a responsive grid.

File: index.html — 1000+ lines, production-ready with dark mode, smooth scroll, and interactive states.

applications with error handling, edge cases, and deployment configs.

STEP 04

Creative output

From design specs to complete prototypes. The assistant generates polished, shipped-quality artifacts — not wireframes.
